LA CIGARRA MINERAL RESOURCE ESTIMATE

La Cigarra Project Open Pit Mineral Resource Estimate, April 4, 2026

Resource Class	Tonnes (M)	Grade					Total Metal				
		Ag (g/t)	Au (g/t)	Pb (%)	Zn (%)	AgEq (g/t)	Ag (Moz)	Au (koz)	Pb (Mlb)	Zn (Mlb)	AgEq (Moz)
Measured	2.93	84	0.06	0.14	0.19	96	7.87	5.60	9.1	12.4	9.01
Indicated	20.09	81	0.06	0.14	0.19	93	52.14	39.60	62.2	84.6	60.01
Measured + Indicated	23.02	81	0.06	0.14	0.19	93	60.02	45.20	71.3	97.0	69.02
Inferred	6.78	79	0.05	0.15	0.17	90	17.25	11.90	22.7	25.5	19.72

Notes:

- The classification of the current MRE into Measured, Indicated, and Inferred is consistent with current CIM Definition Standards For Mineral Resources and Mineral Reserves (CIM, 2014).
- All figures are rounded to reflect the relative accuracy of the estimate, and numbers may not add due to rounding.
- Mineral Resources that are not Mineral Reserves do not have demonstrated economic viability. An Inferred Mineral Resource has a lower level of confidence than that applying to an Indicated Mineral Resource and must not be converted to a Mineral Reserve. It is reasonably expected that most Inferred Mineral Resources could be upgraded to Indicated Mineral Resources with continued exploration.
- It is envisioned that the La Cigarra deposit may be mined using open-pit mining methods. Mineral Resources are reported at a base-case cut-off grade of 30 g/t AgEq. The in-pit Mineral Resource grade blocks are quantified above the base-case cut-off grade, above the constraining pit shell, below topography, and within the constraining mineralized domains (the constraining volumes).
- The results from the pit optimization are used solely for the purpose of testing the “reasonable prospects for economic extraction” by an open pit and do not represent an attempt to estimate Mineral Reserves. There are no Mineral Reserves on the property. The results are used as a guide to assist in the preparation of a Mineral Resource statement and to select an appropriate resource-reporting cut-off grade.
- Mineral Resources are presented undiluted and in situ, constrained by continuous 3-D wireframe models, and are considered to have reasonable prospects for eventual economic extraction at the base-case cut-off grade of 30 g/t AgEq.
- The base-case AgEq cut-off grade considers metal prices of \$36.00/oz Ag, \$3,600/oz Au, \$0.91/lb Pb, and \$1.23/lb Zn, and considers variable metal recoveries for Ag, Au, Pb, and Zn: for oxide mineralization—88.3% for Ag, 37.5% for Au; for sulphide mineralization—89.3% for Ag, 61.8% for Au, 70.0% for Pb, and 59.1% for Zn.
- The base-case cut-off grade of 30 g/t AgEq considers a mining cost of \$2.00/t mined, and processing, treatment, refining, General & Administrative, and transportation cost of \$23.23/t for oxide mineralization, and \$22.33/t for sulphide mineralization.
- The estimate of Mineral Resources may be materially affected by environmental, permitting, legal, title, taxation, socio-political, marketing, or other relevant issues.
- AGEQ = AG PPM + (((AU PPM X AU PRICE/GRAM) + (PB% X PB PRICE/LB) + (ZN% X ZN PRICE/LB))/AG PRICE/GRAM). METAL PRICE ASSUMPTIONS ARE \$36.00/OZ SILVER, \$3,100/OZ GOLD, \$0.91/LB LEAD AND \$1.23/T ZINC.**

(1) Underground mineral resources are reported at a base case cut-off grade of 150 gpt Ag. Values in this table reported above and below the base case cut-off grades should not be misconstrued with a Mineral Resource Statement. The values are only presented to show the sensitivity of the block model estimate to the base case cut-off grade.

(2) All values are rounded to reflect the relative accuracy of the estimate and numbers may not add due to rounding.

COLUMBA MINERAL RESOURCE ESTIMATE NOTES

- (1) *The mineral resource was estimated by Ben Eggers, MAIG, P.Geo. of SGS Geological Services, an independent Qualified Person as defined by NI 43-101. Eggers conducted a site visit to the Columba Property on May 28, 2025. The mineral resource was peer reviewed by Allan Armitage, Ph.D., P.Geo. of SGS Geological Services, an independent Qualified Person as defined by NI 43-101. Armitage conducted a site visit to the Columba Property on May 24-25, 2024.*
- (2) *The classification of the Mineral Resource Estimate into Inferred mineral resources is consistent with current 2014 CIM Definition Standards for Mineral Resources and Mineral Reserves. The effective date of the Columba Property Mineral Resource Estimate (MRE) is May 29, 2025. This is the close out date for the final mineral resource drilling database.*
- (3) *All figures are rounded to reflect the relative accuracy of the estimate and numbers may not add due to rounding.*
- (4) *All mineral resources are presented undiluted and in situ, constrained by continuous 3D wireframe models (considered mineable shapes), and are considered to have reasonable prospects for eventual economic extraction. The mineral resource is exclusive of mined out material.*
- (5) *Mineral resources are not mineral reserves. Mineral resources which are not mineral reserves, do not have demonstrated economic viability. An Inferred Mineral Resource has a lower level of confidence than that applying to an Indicated or Measured Mineral Resource and must not be converted to a Mineral Reserve. It is reasonably expected that the majority of Inferred Mineral Resources could be upgraded to Indicated or Measured Mineral Resources with continued exploration.*
- (6) *The Columba mineral resource estimate is based on a validated drillhole database which includes data from 217 surface diamond drill holes completed between 2019 and March 2025. The drilling totals 53,476 m. The resource database totals 28,448 assay intervals representing 45,805 m of data.*
- (7) *The mineral resource estimate is based on 17 three-dimensional ("3D") resource models representing epithermal veins which comprise the Columba vein system. 3D models of mined out areas were used to exclude mined out material from the current MRE.*
- (8) *Grades for Ag, Pb, and Zn are estimated for each mineralization domain using 1.5 m capped composites assigned to that domain. To generate grade within the blocks, the inverse distance squared (ID^2) interpolation method was used for all domains.*
- (9) *Average density values were assigned to each domain based on a database of 4,049 samples.*
- (10) *It is envisioned that the Columba Project deposits may be mined using underground mining methods. Mineral resources are reported at a base case cut-off grade of 150 g/t AgEq. The mineral resource grade blocks were quantified above the base case cut-off grade, below surface and within the constraining mineralized wireframes.*
- (11) *The underground base case cut-off grade of 150 gpt Ag considers a metal price of US\$26.00/oz Ag and metal recovery of 90% for Ag.*
- (12) *The underground base case cut-off grade of 150 gpt Ag considers a mining cost of US\$60.00/t rock and a processing, treatment and refining, transportation and G&A cost of US\$45.00/t mineralized material.*
- (13) *The estimate of Mineral Resources may be materially affected by environmental, permitting, legal, title, taxation, socio-political, marketing, or other relevant issues.*

D-VEIN

High grade hits flanked by mineralized stockwork and breccia, great continuity both to depth and along strike

- D-Vein has been drilled for 435 meters to a vertical depth of 300 meters
- Undrilled trace of D-Vein adds 800m for a potential strike length of over 1,200 meters.
- High grade is flanked by broad zones of stockwork veining resulting in wide blocks of mineralization

High grade core from hole CDH-20-110

F-VEIN

Extensive vein with wide mineralized intervals, great continuity along trend

- Kootenay Silver has drilled F-Vein has been over a distance of 770 meters and to a vertical depth of 275 meters
- Sampling from u/g workings and drilling assays suggest classic epithermal zoning typical of similar mineral systems worldwide
- Historical underground mining focused on F Vein, the main working saw six levels developed

LA CIGARRA RESOURCE

The base-case AgEq Cut-off grade of 50 g/t AgEq considers metal prices of \$23.50/oz Ag, \$1,800/oz Au, \$1.00/lb Pb and \$1.30/lb Zn, and considers variable metal recoveries for Ag, Au, Pb and Zn: for oxide mineralization - 85% for Ag, 40% for Au, 75% for Pb and 65% for Zn; for sulphide mineralization - 92% for Ag, 40% for Au, 91% for Pb and 85% for Zn.

¹AgEq = Ag ppm + (((Au ppm x Au price/gram) + (Pb% x Pb price/t) + (Zn% x Zn price/t))/Ag price/gram). Metal price assumptions are \$23.50/oz silver, \$1,800/oz gold, \$1.00/lb lead and \$1.30/lb zinc.

La Cigarra Mineral Resource Estimate Notes:

1. The Mineral Resource Estimate was estimated by Allan Armitage, Ph.D., P. Geo. of SGS Geological Services and is an independent Qualified Person as defined by NI 43-101. Dr Armitage conducted a recent site visit to the La Cigarra Property on November 28 and 29, 2023.
2. The classification of the current Mineral Resource Estimate into Measured, Indicated and Inferred mineral resources is consistent with current 2014 CIM Definition Standards - For Mineral Resources and Mineral Reserves. The effective date for the Updated Mineral Resource Estimate is November 29, 2023.
3. All figures are rounded to reflect the relative accuracy of the estimate and numbers may not add due to rounding.
4. The mineral resource is presented undiluted and in situ, constrained by continuous 3D wireframe models, and are considered to have reasonable prospects for eventual economic extraction.
5. Mineral resources which are not mineral reserves do not have demonstrated economic viability. An Inferred Mineral Resource has a lower level of confidence than that applying to an Indicated Mineral Resource and must not be converted to a Mineral Reserve. It is reasonably expected that most Inferred Mineral Resources could be upgraded to Indicated Mineral Resources with continued exploration.
6. The La Cigarra mineral resource estimate is based on a validated database which includes data 201 surface diamond and RC drill holes totalling 36,988 m. The resource database totals 26,419 assay intervals representing 34,447 m of drilling. The average assay sample length is 1.30 m.
7. The mineral resource estimate is based on 9 three-dimensional ("3D") resource models, constructed in Leapfrog. Grades for Ag, Au, Pb and Zn were estimated for each mineralization domain using 1.5 metre capped composites assigned to that domain. To generate grade within the blocks, the inverse distance squared (ID^2) interpolation method was used for all domains. Each domain was then subdivided into oxide and sulphide domains.
8. Average density values were assigned to oxide and sulphide domains and a waste domain based on based on a database of 1,412 samples.
9. It is envisioned that the La Cigarra deposit may be mined using open-pit mining methods. Mineral resources are reported at a base case cut-off grade of 50 g/t AgEq. The in-pit Mineral Resource grade blocks are quantified above the base case cut-off grade, above the constraining pit shell, below topography and within the constraining mineralized domains (the constraining volumes).
10. The results from the pit optimization are used solely for the purpose of testing the "reasonable prospects for economic extraction" by an open pit and do not represent an attempt to estimate mineral reserves. There are no mineral reserves on the Property. The results are used as a guide to assist in the preparation of a Mineral Resource statement and to select an appropriate resource reporting cut-off grade.
11. The base-case AgEq Cut-off grade considers metal prices of \$23.50/oz Ag, \$1,800/oz Au, \$1.00/lb Pb and \$1.30/lb Zn, and considers variable metal recoveries for Ag, Au, Pb and Zn: for oxide mineralization - 85% for Ag, 40% for Au, 75% for Pb and 65% for Zn; for sulphide mineralization - 92% for Ag, 40% for Au, 91% for Pb and 85% for Zn.
12. The pit optimization and base case cut-off grade of 50 g/t AgEq considers a mining cost of US\$2.50/t mined, and processing, treatment, refining, G&A and transportation cost of USD\$22.40/t of mineralized material.
13. The estimate of Mineral Resources may be materially affected by environmental, permitting, legal, title, taxation, socio-political, marketing, or other relevant issues.

Notes to the 2023 Promontorio Resource Table:

- Resources are reported using the 2014 CIM Definition Standards and were estimated using the 2019 CIM Best Practices Guidelines, as required by NI43-101
- The base case Mineral Resource has been confined by "reasonable prospects of eventual economic extraction" shape using the following assumptions:
 - Metal prices of US\$22/oz Silver, US\$1800/oz Gold, US\$0.95/lb Lead and US\$1.25/lb Zinc. Metallurgical recovery of 74% Silver, 70% Gold, 81% Lead and 88% Zinc
 - Payable metal of 95% Silver, 99% Gold in dore 95% Au in Pb concentrate, 95% Lead and 85% Zinc. Lead payable assumes a concentrate grade of 65% Pb and a 3% unit deduction. Zinc payable assumes a concentrate grade of 52% Pb and an 8% unit deduction. Offsite costs (transport, smelter treatment and refining) of US\$1.5/oz Silver and gold in the Pb concentrate, US\$10 oz Gold, US\$ 0.15/lb Lead and US\$0.31/ lb Zinc. Lead offsite costs assume 100 \$US/dmt transport, 100 \$US/ dmt treatment. Zinc offsite costs assume 100 \$US/dmt transport, 200 \$US/ dmt treatment.
- Processing, General, and Administrative ("G&A") costs of US\$ 12/ tonne milled. Mining cost of US\$2.00 / tonne
- 50 degree pit slopes with the 150% price case pit shell is used for the confining shape
- The resulting NSR = Ag*US\$0.63/g*74% + Au*US\$56.71/g*70% + 22.0462*(Pb*US\$0.77/lb*81% + Zn*US\$ 0.80/lb*88%)
- The specific gravity of the resource averages 2.79 and is calculated from the Lead and Zinc content. Non-mineralized material is assigned an SG of 2.73.
- Numbers may not add due to rounding.

Notes to the 2023 La Negra Resource Tables:

- Resources are reported using the 2014 CIM Definition Standards and were estimated using the 2019 CIM Best Practices Guidelines, as required by NI43-101
- The base case Mineral Resource has been confined by "reasonable prospects of eventual economic extraction" shape using the following assumptions:
 - Metal prices of US\$22/oz Silver, US\$1800/oz Gold
 - Recovery is assumed to be as for dore. Metallurgical recovery of 82% Silver and 77% Gold in the Oxide zone, 85% Silver and 73% Gold in the Mixed zone, and 90% Silver and 31% Gold in the Sulfide zone.
 - Payable metal of 99% for Silver and Gold. Offsite costs (transport, smelter treatment and refining) of US\$0.25/oz Silver and US\$10/oz gold.
 - Processing, General, and Administrative (G&A) costs of US\$ 12/ tonne milled. Mining cost of US\$2.00/tonne
 - 50 degree pit slopes with the 150% price case pit shell is used for the confining shape
- The resulting NSR = $\text{Ag} \times \text{US\$0.69/g} \times \text{Zone Ag Recovery\%} \times 0.82 + \text{Au} \times \text{US\$56.97/g} \times \text{Zone Au Recovery} \times 0.77\%$
- Silver Equivalent (AgEq) = $\text{NSR} / (\text{US\$0.69/g} \times \text{Ag Recovery\%} \times 0.82)$
- The specific gravity is assigned by rock type as 2.52 in Oxides, 2.59 in Mixes and 2.61 in Sulfides
- Numbers may not add due to rounding.
